The revolution in information and communication technologies (ICTs) has vast implications for the developing world, but what tangible benefits has it bought, when issues of social inclusion and exclusion, particularly in the developing world, remain at large? In addition, the gender digital divide is growing in the developing world, particularly in Africa - so what does ICT mean to African women? African Women and ICTs explores the ways in which women in Africa utilize ICTs to facilitate their empowerment; whether through the mobile village phone business, through internet use, or through new career and ICT employment opportunities. Based on the outcome of a extensive research project, this timely books features chapters based on original primary field research undertaken by academics and activists who have investigated situations within their own communities and countries. The discussion includes such issues as the notion of ICTs for empowerment and as agents of change, ICTs in the fight against gender-based violence, and how ICTs could be used to re-conceptualize public and private spaces. ICT policy is currently being made and implemented all over Africa, but the authors argue that this is happening mostly in the absence of clear knowledge about the ways gender inequality and ICTs are impacting each other and that by becoming alert to a gender dimension in ICT developments at an early stage of the information revolution, we may be able to prevent greater scaled undesirable effects in the future.

The Information Economy Report 2010: ICT, Enterprises and Poverty Alleviation is the fifth in the flagship series published by the United Nations Conference on Trade and Development (UNCTAD). As one of few annual reports that monitor global trends related to information and communication technologies (ICTs) from a development perspective, the Report is a valuable reference source for policymakers in developing countries. In the 2010 edition, special attention is given to the potential impact of ICTs in enterprises for reducing poverty and improving livelihoods. The evidence presented in this Report suggests that more attention should be given by policymakers and other stakeholders to opportunities in this area.

Technological advancements in the West since the last millennium have contributed to global modernity. Technologies set conditions for the closeness of the nation-states and for the affinity of the global and the local. They are also penetrating everyday life, and even sometimes the body, producing radical social changes. Yet, arguing that new technologies bring a new life and a promising future to global societies remains a questionable thesis.This book attempts to explore the relationship between new technologies and global societies, to gain an understanding of how the positive as well as negative influences of technologies bear on global societies, how their practices of use are resisted or re-interpreted by these societies, and how their social meaning is constituted through the process of negotiation with these societies. Part 1 is on science, technology, culture, and the body; Part 2 is on new media and generations, and Part 3 is on information and communication technologies (ICTs) and work.This book has been selected for coverage in:Index to Social Sciences & Humanities Proceedings® (ISSHP®/ISI Proceedings)Index to Social Sciences & Humanities Proceedings (ISSHP CDROM version/ISI Proceedings)

Despite being an accepted construct in traffic and transport psychology, the precise nature of behavioural adaptation, including its causes and consequences, has not yet been established within the road safety community. A comprehensive collection of recent literature, Behavioural Adaptation and Road Safety: Theory, Evidence, and Action explores behavioural adaptation in road users. It examines behavioural adaptation within the context of historical and theoretical perspectives, and puts forth tangible—and practical—solutions that can effectively address adverse behavioural adaptation to road safety interventions before it occurs. Edited by Christina Rudin-Brown and Samantha Jamson, with

chapters authored by leading road safety experts in driver psychology and behaviour, the book introduces the concept of behavioural adaptation and details its more relevant issues. It reviews the definition of behavioural adaptation that was put forward by the OECD in 1990 and then puts this definition through its paces, identifying where it may be lacking and how it might be improved. This sets the context for the remaining chapters which take the OECD definition as their starting points. The book discusses the various theories and models of behavioural adaptation and more general theories of driver behaviour developed during the last half century. It provides examples of the "evidence" for behavioural adaptation—instances in which behavioural adaptation arose as a consequence of the introduction of safety countermeasures. The book then focuses on the internal, "human" element and considers countermeasures that might be used to limit the development of behavioural adaptation in various road user groups. The book concludes with practical tools and methodologies to address behavioural adaptation in research and design, and to limit the potential negative effects before they happen. Supplying easy-to-understand, accessible solutions that can be implemented early on in a road safety intervention's design or conception phase, the chapters represent the most extensive compilation of literature relating to behavioural adaptation and its consequences since the 1990 OECD report. The book brings together earlier theories of behavioural adaptation with more recent theories in the area and combines them with practical advice, methods, and tangible solutions that can minimise the potential negative impact of behavioural adaptation on road user safety and address it before it occurs. It is an essential component of any road safety library, and should be of particular relevance to researchers, practitioners, designers, and policymakers who are interested in maximizing safety while at the same time encouraging innovation and excellence in road transport-related design.

Mobile phones have become an integral part of society, as their convenience has helped democratize and revolutionize communication and the marketplace of ideas. Because of their ubiquity in higher education, undergraduate classrooms have begun to utilize smartphones and tablets as tools for learning. The Handbook of Research on Mobile Devices and Applications in Higher Education Settings explores and fosters new perspectives on the use of mobile applications in a classroom context. This timely publication will demonstrate the challenges that universities face when introducing new technologies to students and instructors, as well as the rewards of doing so in a thoughtful manner. This book is meant to present the latest research and become a source of inspiration for educators, administrators, researchers, app developers, and students of education and technology.

As with television and computers before it, today's mobile technology challenges educators to respond and ensure their work is relevant to students. What's changed is that this portable, cross-contextual way of engaging with the world is driving a more proactive approach to learning on the part of young people. The first full-length authored treatment of the relationship between the centrality of technological development in daily life and its potential as a means of education, Mobile Learning charts the rapid emergence of new forms of mass communication and their potential for gathering, shaping, and analyzing information, studying their transformative capability and learning potential in the contexts of school and socio-cultural change. The focus is on mobile/cell phones, PDAs, and to a lesser extent gaming devices and music players, not as "the next new thing" but meaningfully integrated into education, without objectifying the devices or technology itself. And the book fully grounds readers by offering theoretical and conceptual models, an analytical framework for understanding the issues, recommendations for specialized resources, and practical examples of mobile learning in formal as well as informal educational settings, particularly with at-risk students. Among the topics covered: • Core issues in mobile learning • Mobile devices as educational resources • Socioeconomic approaches to mobile learning • Creating situations that promote mobile learning • Ubiquitous mobility and its implications for pedagogy • Bridging the digital divide at the policy level Mobile Learning is a groundbreaking volume, sure to stimulate both discussion and innovation among educational professionals interested in technology in the context of teaching and learning. What are the negative effect of electromagnetic waves on human brains from smartphone influenceScientists proved that the smartphone is a source of the eminence of electromagnetic waves. Numerous studies have been conducted in the past years to identify the effect of electromagnetic waves emitted from the cell phones on human health.However, it has not proved smartphone can influence our health certainly. As soon as mobile phones more and more part of our lives, the world is continuing research to prove whether cell phones are harmful to human health. Today, there is no official statement announced by laboratory or medical center to answer this question: The complexity of the analysis of the statistical data makes the task more difficult for researchers. The impact of harmful radiation emitted from cell phones is still being studies.Nowadays, human are accepted to use mobile phone in any time, any where popularly. Although, mobile is a good small size and convenient carrying of communication tool for human to use when we need to make phone calls to anyone in anywhere and any time conveniently. But, I feel that it will harm human health when we often use this communication tool any time.However, some doctors indicate cell phones can cause brain cancer risk easily. But they have not any evidences to prove it is truth nowadays. Hence, the statement that cell phones can cause cancer has been not confirmed. The studies failed to prove that cellphones make a major risk develop cancer among frequent users. The main issues when conducting studies are some people may not accurately report the usage as they don't exactly remember how often they use the cell phone excluding speaker phone, and it is still difficult to measure the impact of other factors that may accelerate the cancer development for excessive cell phone users.Although, it is not proved that cellphone can use brain cancer to human when we often use. But some scientists or medical professionals have proved that the cell phone users often use cell phones, it is possible to cause human physical illnesses, such as upper extremities, back and neck caused unhealthy and pain.A smartphone or handhelds device combines advanced computing capability, such as internet communication, information retrieval, video, e-commerce and other features, that make device highly popular among people. According to Pew research center investigating, it showed that the number of

smartphone owners comprises 56% of American adults in 2013 year and their average daily use of the device is about 195 minutes. The number of cellphone users increase every year. Various studies show the connection between cellphones usage and physical illness of the users' health. Some studies report that users complain about a headache, hand tremor and finger discomfort and pain of physical illnesses numbers increasing.In fact, most mobile hand-held device users complain of discomfort at least on one area of upper extremities, back or neck. Long -term usage of the device leads to additional tension on tenders, muscles and tissue etc. different kind of physical illnesses. Moreover, in research conducted by a group of Korean scientists from Inji University focused that an effect of cellphone on hand-held device users was a significant association between the total time spend using a mobile device each day and pain in the right shoulder, and between times spend internet browsing and pain at the base of the right thumb.

Connecting the study of cognition to everyday life in an unprecedented way, E. Bruce Goldstein's COGNITIVE PSYCHOLOGY: CONNECTING MIND, RESEARCH, AND EVERYDAY EXPERIENCE gives equal treatment to both the landmark studies and the cutting-edge research that define this fascinating field. A wealth of concrete examples and illustrations help students understand the theories of cognition-driving home both the scientific importance of the theories and their relevance to students' daily lives. Goldstein's accessible narrative style blends with an art program that makes difficult concepts understandable. Students gain a true understanding of the "behind the scenes" activity that happens in the mind when humans do such seemingly simple activities as perceive, remember, or think. Goldstein also focuses on the behavioral and physiological approaches to cognition by including physiological materials in every chapter. As is typical of his work, this fourth edition is a major revision that reflects the most current aspects of the field. How wireless technology is redefining the relationship of communication, technology, and society around the world—in everyday work and life, in youth culture, in politics, and in the developing world. Wireless networks are the fastest growing communications technology in history. Are mobile phones expressions of identity, fashionable gadgets, tools for life—or all of the above? Mobile Communication and Society looks at how the possibility of multimodal communication from anywhere to anywhere at any time affects everyday life at home, at work, and at school, and raises broader concerns about politics and culture both global and local. Drawing on data gathered from around the world, the authors explore who has access to wireless technology, and why, and analyze the patterns of social differentiation seen in unequal access.They explore the social effects of wireless communication—what it means for family life, for example, when everyone is constantly in touch, or for the idea of an office when workers can work anywhere. Is the technological ability to multitask further compressing time in our already hurried existence? The authors consider the rise of a mobile youth culture based on peer-to-peer networks, with its own language of texting, and its own values. They examine the phenomenon of flash mobs, and the possible political implications. And they look at the relationship between communication and development and the possibility that developing countries could "leapfrog" directly to wireless and satellite technology. This sweeping book—moving easily in its analysis from the United States to China, from Europe to Latin America and Africa—answers the key questions about our transformation into a mobile network society.

"This multiple-volume publication advances the emergent field of mobile computing offering research on approaches, observations and models pertaining to mobile devices and wireless communications from over 400 leading researchers"--Provided by publisher.

TRB's second Strategic Highway Research Program (SHRP 2) Report S2-S06-RW-2: Naturalistic Driving Study: Collecting Data on Cell Phone Use details the methodology used to acquire cell phone use records from a subset of participants in the SHRP 2 Naturalistic Driving Study (NDS) during the time when they were enrolled in the study. The cell phone records were then matched with participants' NDS driving data to identify the times while they were driving when they may have been using their cell phones. The report is designed to provide researchers with information about the Cell Phone Records Study (CPRS) data and how the data were collected. The report describes the methods used to recruit and enroll CPRS participants, the collaboration with the cell phone carriers, and the processes of obtaining data from the carriers and directly from the participants. It also provides summary information on the data collected and addresses some limitations of the data.

The new research findings, the concept of mobile sensing, and psychological insights about the formation and structure of real-life social networks are integrated into the field of social networking. Finally, for this novel integration, the author presents concepts, decentralized software architectures, and fully realized prototypes that recommend new contacts, media, and locations to individual users and groups of users. Provides a psychoinformatical research framework for mobile sensing and user personality; Includes an app, a privacy model, example studies, and empirical insights about study participants' willingness to share data; Introduces decentralized social networking concepts and applications based on psychological research results.
